SECTION 1

What is TwinBiz AI?

Imagine having an exact copy of your shop inside your computer — same products, same customers, same sales pattern. Now imagine you could **test your business decisions on the copy first**: raise a price, hire a person, launch a new product — and see what would happen *before* spending a single real rupee.

That copy is called a **digital twin**, and that is exactly what TwinBiz AI builds for you.

The golden rule: every number you see is calculated from *your* business data, and every prediction explains itself. Predictions are clearly labeled "*Predicted, not guaranteed*" — they are smart estimates, not promises.

SECTION 2

Getting started

Creating your account

1. Open the website and click **Get Started** (or **Sign in** if you already have an account).
2. Register with your name, email and a password (minimum 6 characters).

Want to explore first? Use the demo

On the login page you can enter with the demo account — a fully loaded supermarket ("SmartMart") with one full year of realistic history. Everything in this manual can be tried there safely.

The Setup Wizard — creating your twin

After registering, a short 3-step wizard builds your twin:

1. **About your business** — name, type (Supermarket, Restaurant, Pharmacy, Bakery...) and location.
2. **Your scale** — roughly how many employees, customers, monthly revenue and expenses you have. Estimates are fine; you can change them later in Settings.
3. **How do you want to start?**
 - **Use Demo Supermarket** — instantly get 365 days of realistic sample data so every chart works from minute one. Sample data is always labeled **DEMO** in the app.
 - **Upload Real Business Data** — start empty and bring in your Excel/CSV files (see Data Center).
 - **Manual Setup** — start empty and add products by hand.

SECTION 3

Dashboard — your morning glance

What it shows: the state of your whole business on one screen.

- **Status strip (top):** whether your twin runs on **DEMO** data, **LIVE** data, or has gone **STALE** (no recent data), plus a *data quality* and *confidence* percentage — the more complete and recent your data, the more you can trust the predictions.
- **Big number tiles:** this month's revenue, profit, expenses and customers — each with an arrow showing up or down versus last month.
- **Business Health gauge:** one 0–100 score summarising finance, inventory, operations, customers and marketing. Above 70 is good; below 50 needs attention.
- **Charts:** revenue vs expenses (30/90 days), weekly profit, customer footfall, top-selling products and busiest hours.
- **Upcoming Risks & AI Suggestions:** problems the twin has spotted and what to do about them.

 **How to use it:** open it every morning like a newspaper. Green arrows — carry on. Red arrows or a risk warning — click through to the page it points to.

SECTION 4

Digital Twin — walk through your virtual shop

What it shows: your shop drawn as an interactive map — departments, shelves (one card per product), your team and your suppliers.

Shelf colors tell the story at a glance:

- **Green** healthy stock
- **Yellow** running low — reorder soon
- **Red** critical — about to run out
- **Orange** overstocked — money sitting idle on the shelf

 **How to use it:** click anything. Click a shelf → that product's margin, days of stock remaining, and a tip like "order 140 units now to cover 30 days." Click an employee or supplier → their key numbers too.

SECTION 5

Products — your catalog

What it does: manage everything you sell — name, brand, price, cost, stock level, tax, supplier, shelf life and more.

- **Search and filter** by name, brand or category; sort by price, stock, and more.
- **Add Product** — only name, price and cost are truly required. Skip the SKU (product code) and one is generated automatically.

- **Edit / Delete** with the icons on each row.
- The **stock status** column uses the same green/yellow/red/orange language as the Digital Twin.

SECTION 6

AI Business Simulator — test decisions safely

This is the heart of TwinBiz. Eight sliders, each one a real business decision: price, marketing budget, number of employees, discounts, inventory purchases, store hours, supplier cost, and operating expenses.

How to use it

1. Move any slider — say, price **+10%**.
2. Instantly see the predicted result: revenue, profit, customers, satisfaction, cash flow and a risk score — side by side with your current numbers, plus a plain-English verdict like "⚠️ *this reduces profit.*"
3. Expand "**How was this predicted?**" under any result to see the reasoning in plain words (e.g. *"supermarket customers are price-sensitive — a 10% increase typically costs ~17% of demand"*).
4. Like an outcome? Click **Save as Scenario** to keep it for comparison.

Quick What-Ifs

One-click presets — *"Increase milk price by ₹2"*, *"Hire one extra cashier"*, *"Launch 10% festival offer"* — already ranked by predicted profit impact.

Product Price mode

Switch modes to test a price change on **one specific product** (e.g. Amul Milk ₹28 → ₹30) and see predicted demand, profit, and the risk that customers switch to another brand.

SECTION 7

Scenarios — compare your saved plans

Puts your saved simulator experiments side by side with your current business: revenue, profit, expenses, customers, satisfaction, risk and health in one table. The best value in each row is highlighted, the overall winner gets a crown 🏆, and badges mark *best profit*, *best growth*, *lowest risk* and the *AI-recommended* balance of all three.

SECTION 8

Forecasting — see the weeks ahead

Predicts your revenue, customers, orders or expenses for the next 14 to 90 days using a machine-learning model trained on your own history. It learns your weekly rhythm — if Sundays are big for you, the forecast knows.

How to read the chart

- **Solid line** — what actually happened.
- **Dashed line** — the prediction.
- **Shaded band** — the realistic range (the future usually lands inside it).
- **Model confidence** — how well the model fits your history. Higher = more reliable.

SECTION 9

AI Advisor — ask anything

A chat assistant that knows *your* numbers. Ask things like "Should I hire another employee?", "What should I do today?", "Should I launch this product?"

Every answer is grounded in your live business data and structured as: explanation → prediction → recommendation → risk to watch → confidence level. Your chat history is saved.

SECTION 10

Product Launch Lab — test a product before you stock it

The problem it solves: buying stock for a new product is a gamble. The Launch Lab lets you run the whole launch inside the twin first.

1. **Create an experiment** — describe the product: costs (supplier, transport, wastage...), the price range you'd consider, planned stock, marketing budget, target customers, shelf placement, and a competitor's price if you know it. Try the one-click **demo product** first.
2. **Price Sweep** — tests every price in your range and shows the best price for profit, for adoption, and the balanced recommendation.
3. **Discount Lab** — which launch offer (0–20%) pays off.
4. **Inventory Lab** — how many units to stock first, so you neither sell out nor sit on dead stock.
5. **Find Best Launch Strategy** — the AI searches every combination of price, discount, stock and marketing within your limits and hands you the best plan.
6. **Launch Analysis** — the full picture: a 0–100 launch risk score, break-even timeline, the best launch window (festivals considered), and **cannibalization** — plain meaning: how much the new product will "steal" from your existing similar products.
7. **"Should I Launch This Product?"** — the final verdict: YES / CONDITIONAL YES / WAIT / HIGH RISK, with the reason and a concrete recommendation.

SECTION 11 · THE AI LAB

Time Machine

Travel to any past date and see your business as it was that day — sales, cash, top sellers — with AI explanations of what happened: "*Revenue spiked +43% — Holi festival window*" or "*Milk had no sales for 5 days — likely stockout, about 100 lost units.*"

💡 **How to use it:** drag the timeline slider or tap the **-90d / -30d / -7d** shortcuts. Read the replayed numbers, then check "*What the AI found in this window.*"

Tomorrow's Headlines (bottom of the page)

Playful newspaper headlines about your *future*, written from your real forecast — "*Store Faces Stockouts During Diwali Rush.*" Clearly labeled as illustrations; if a headline looks bad, the story names the fix.

SECTION 12 · THE AI LAB

AI CEO Mode

The AI drafts real, specific decisions for you — "*Order 168 units of Lays Chips*", "*Raise Fortune Oil to ₹187 (worth about +₹2,100/month)*" — each with its reasoning and predicted value. **Nothing happens until you click Approve.**

- Approving a **price** decision applies it instantly (visible in Products).
- Approving a **restock** records the order for you to place with your supplier.
- Rejected ideas stay away for two weeks. The **History** tab is your decision diary.

SECTION 13 · THE AI LAB

Business Weather

Your next 7 or 14 days as a weather report. Three readings per day: **Sales** (will it be a good day?), **Inventory** (a 🌪️ storm on the exact day something sells out) and **Cash** (will the day end positive?).

💡 One glance replaces five charts: a storm icon means act today — hover it to see the exact numbers behind it.

SECTION 14 · THE AI LAB

Stress Test

What if a supplier fails? Staff don't show up? Prices inflate 15%? Six crisis scenarios run against your real numbers — supplier delay, staff absence, inflation, fuel surge, a pandemic-style demand collapse, and a festival rush — and answer three questions each:

- **How much would it cost me per month?**
- **How long could I survive it?** (your "survival time" in months)

- **What's the recovery plan?** (a concrete playbook per scenario)

💡 Rehearse the bad day before it happens — then practice the recovery moves in the Simulator.

SECTION 15 · THE AI LAB

Business DNA & Mood

Your business gets a personality profile: **Growth Character, Demand Stability, Inventory Efficiency, Customer Loyalty, Resilience** and **Growth Potential** — each scored out of 100 with the sentence of proof that produced it. Above it sits a simple mood face (😊 Happy · 😊 Content · 😟 Stressed · 😞 Struggling) with the exact reasons.

💡 "Loyalty: Very Strong, but Resilience: Fragile" is a strategy in one line — customers love you, but one bad month hurts, so build margin. Check it monthly.

SECTION 16 · THE AI LAB

Opportunity Radar

The opposite of a risk report — it hunts for **upside**: upcoming festivals (sized from how much *your own* sales actually rose last year), your strongest weekday, categories trending up, and money locked in slow-moving stock.

Each card shows the **Evidence** (where the number comes from), the **Play** (what to do), suggested products, and the potential value in ₹ — e.g. "*Diwali window in 23 days — last year this window ran +38%. Stock fast movers ~15 days ahead. Potential ≈ ₹58,000.*"

SECTION 17

Data Center — bring in your real data

Upload your real business records from Excel (.xlsx) or CSV files — products, daily sales, product-level sales, expenses, suppliers, employees.

1. Pick what type of data the file contains.
2. Upload it. The app **reads your column names automatically** ("Item Name" → product name, "Qty" → quantity...) and shows you the match to confirm or fix.
3. **Validate** — every row is checked; problems are listed with the row number and reason. Nothing invalid slips in silently.
4. **Import** — clean rows are added to your twin. Re-importing the same file safely *updates* records rather than duplicating them.

The status panel always shows how much of your twin is demo data vs real data.

The Intelligence pages

Inventory — never run out, never over-buy

- **Restock table:** for every product — days until it runs out, the date to reorder by, and a suggested order quantity, sorted by urgency.
- **Fast movers:** your top sellers — protect their stock first.
- **Slow movers:** products tying up money — candidates for a clearance offer.

Financials — where the money goes

Twelve months of revenue, expenses and profit; an expense breakdown chart; cumulative cash flow; return on spending; and your **break-even point** — the monthly revenue you need before profit begins, with a clear above/below indicator.

Customers — who keeps you in business

New vs returning customer trends, retention and churn rates, average bill size, and estimated **customer lifetime value** (what a typical customer is worth over a year). Customer segments (Loyal / Regular / Occasional / New / At-Risk) are group-level estimates from footfall history — no individual customer is tracked.

Risk Analyzer, Recommendations & Alerts

Risks: continuously scans for products about to run out, overstock, negative cash flow, thin margins, falling sales, dropping footfall and understaffing — ranked critical → low, always with concrete numbers ("*Milk runs out in ~3 days*").

Recommendations: turns each risk into a prioritized action with the reason, expected benefit and estimated monthly ₹ value — with a **Simulate** button to test it safely first.

Alert Center: all warnings as color-coded cards, filterable by severity. The bell icon in the top bar shows the live count on every page.

SECTION 22

Reports & Settings

Reports: daily, weekly or monthly business reports — summary numbers, health scores, risks and recommended actions, laid out like a printable document. **Export CSV** downloads your raw day-by-day numbers for Excel; **Print / PDF** uses your browser's print dialog.

Settings: your profile, dark/light theme, and all business details (employees, revenue, expenses, hours). Keep these roughly up to date — the twin calibrates itself against them.

SECTION 23

Your first hour — a guided tour

1. **Log in with the demo account** and open the **Dashboard** — get familiar with the tiles.
2. Open the **Digital Twin** and click a red shelf.
3. Go to the **Simulator** — drag price +10%, watch the prediction, then click the *festival offer* preset. **Save it as a scenario.**
4. Open **Scenarios** and find the crown .
5. Visit the **AI Lab**: slide the **Time Machine** back 90 days, glance at the **Weather**, run your eye down the **Stress Tests**.
6. Open **AI CEO Mode** and approve or reject a proposal — see what happens.
7. Ask the **Advisor**: "What should I do today?"
8. Ready for real data? Create your own business in the Setup Wizard with **Upload** or **Manual** mode.

SECTION 24

Common questions

Question	Answer
Are the predictions guaranteed?	No — and the app never pretends they are. They are calculated estimates from your own history, always labeled " <i>Predicted, not guaranteed</i> ", always showing their reasoning and a confidence level. Use them the way you'd use an experienced advisor's opinion.
What's the difference between DEMO and LIVE data?	Demo data is realistic sample data so you can explore instantly, and it is always labeled DEMO. The moment you import or add real data, the label changes — the app never mixes them up silently.
Will the AI change anything without asking me?	No. The only feature that <i>applies</i> changes is AI CEO Mode, and it acts only when you click Approve .
Some rows were rejected when I imported a file. Is my data broken?	No — the validation report lists exactly which rows had problems (a bad date, a negative price...) and why. Fix those rows and re-import; existing records update in place.
How do I start over with fresh demo data?	Ask your administrator to reset the database — the demo account and its full year of data are recreated automatically.

TwinBiz AI — your business, twice. One in the real world, one where mistakes are free.
